NEW ENGLAND - JANUARY 1951

W. H. Tracy, Section Director - Boston, Mass.

WEATHER SUMMARY

The month opened, as did the three previous months, with a warm front passing over the Section, which, by the 4th raised the daytime temperatures to the 60's in the Southern Division and to the 50's in the Northern Division, with thawing day and night over all New England. The moderate snow cover in the interior highlands, which had permitted one weekend of winter sports was much reduced. In other parts of the Section the thin cover entirely disappeared on the 3d. The maxima of the 4th and 5th approximated the date records and at the Section Center exceeded them. On the night of the 7-8th there occurred the first general substantial snowstorm of the season, depositing 4 to 9 inches over much of the Section except near the south coast. Hazardous driving conditions occasioned many skidding accidents-four deaths were attributed to storm causes. An extended mild period, devoid of storms, ensued for the next two weeks. The snow cover vanished from coastal and extreme southern areas, and shrank elsewhere except in northern Maine, where some stations had more than twenty inches on the ground in the middle of the month. Under the prevailing pressure patterns no Arctic air masses could intrude the Section and even the northernmost stations had no sub-zero minima.

Cyclonic systems, of no great energy, passed eastward with some regularity and on the 19th, in connection with a shallow trough of low pressure that moved in from central Canada and the eastern Great Lakes, a series of winter thunderstorms of the high elevation type reached western Connecticut on the morning of the 19th. A great surge of cold Canadian air was brought down over the Section on the 21st in the rear of a deepening depression that moved from Ontario to the Labrador Coast. Its effect was abrupt and brief but was of cold wave proportions and in sharp contrast to the extraordinary warmth that it displaced, for it followed two days of breaking of date records of maximum temperature. On the night of the 28-29th a freezing rain coated all surfaces with one half to an inch of ice throughout the Southern Division, creating extremely slippery travel conditions, directly responsible for three deaths and scores of injuries. This condition was but little alleviated on the 31st, when the coldest weather of the season arrived, accompanied by a light, fluffy snow that concealed the under-coating of ice. Sub-zero temperatures were reported in all parts of the Section except south coastal. This served to reduce somewhat the monthly average temperature which, notwithstanding, was well above normal.

For three successive years now, January in New England has been mild, and in each of these years the December previous has likewise been mild. The effect on seasonal business has been pronounced, and to winter recreational operators well-nigh disastrous. Except for the northeast snowstorm of the 7-8th, storm centers passed to the west or north of the center of the Section, inducing warm air flows into most of the area, producing active thaws on several occasions even to the northernmost parts. At the end of the month the snow cover was far less than normal, and was in fact insignificant except in northern New Hampshire and Maine. Such depths as 16 to 23 inches could be found only in some of the notches and along the northern boundary. Stream flow and ground-water levels were near or above normal. Water in storage reservoirs remained above normal despite the seasonal withdrawals.

The Section average temperature, based upon the records of 157 stations was 26.0°, which is 3.5° above the mean for the past 64 years. The highest monthly mean reported was 37.3° at North Truro, Mass.; the lowest 13.6° at Caribou, Me. The highest recorded was 64° at Providence, R.I., on the 19th; the lowest -47° at Lac Frontiere, Me., on the 31st. The average precipitation for the Section, based upon the records of 152 stations, was 2.99 inches, which is 0.43 inch less than the mean for the past 64 years. The greatest monthly amount reported was 5.44 inches at Prospect, Conn.; the least 1.36 inches at McIndoe Falls, Vt. The greatest amount in any observational day was 2.70 inches at Prospect, Conn. The average snowfall for the Section was 11.9 inches, which is 3.8 inches less than the mean for the past 64 years.

M.T.N.

ACKNOWLEDGMENTS

In addition to the climatological data from some 6,000 Weather Bureau and cooperative weather stations, this bulletin series contains records from Hydroclimatic Network Stations which were formerly reproduced in the Hydrologic Bulletin Series. The Hydroclimatic Network is a nationwide net of rain gages--mostly of the recording type which produce continuous records of precipitation. It was established in 1939 at the request of the Corps of Engineers, Department of the Army, to supplement existing precipitation stations in order to provide records of rainfall intensity which were essential to the planning of flood control and related works by the Corps of Engineers. This Network, now numbering about 2,000 recording, and 1,000 non-recording rain gages, has been maintained by the Weather Bureau through working funds transferred annually to the Weather Bureau by the Corps of Engineers. These transfers averaged about $250,000 per year between 1940 and 1944, and nearly $375,000 since that date. For the years 1940-42, the Department of Agriculture transferred about $100,000 per year to provide data required in its work, and since 1947 the Bureau of Reclamation has transferred about $25,000 per year to meet the increasing needs of their program in the Western States.

Previous to the introduction of this bulletin series, data from Hydroclimatic Network stations were presented in bulletins (Hydrologic Bulletins) which were issued monthly for each of 8 drainage areas embracing the entire United States, but since the Network was established to meet the internal requirements of the Federal agencies referred to above, no provision was made for public dissemination of the data, distribution being limited to cooperating agencies and to certain public repositories. A list of locations where reference copies of the Hydrologic Bulletin Series are available for inspection may be obtained upon application to Chief, U.S. Weather Bureau, Washington 25, D.C.

Many other records published in this bulletin have been made available through the cooperation of various public offices, private agencies, and individuals as listed in the Station Index.

REFERENCE NOTES

The four digit identification numbers in the index column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the above table are in local Standard Time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperatures in °F, precipitation and evaporation in inches, and wind movement in miles. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning with July 1948.

Amounts in Table 4 are from recording gages. Traces are not shown.

Amounts in Table 3 are from non-recording gages, unless otherwise indicated.

Data in Tables 3, 5, 6, and snowfall data in Table 7 are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 7:30 P.M. E.S.T.

- - No record in Tables 3, 4, 6, 7 and the Station Index. No record in Tables 2 and 5 is indicated by no entry. When hourly precipitation is missing or accumulated for several days, only the first and last days are shown in Table 4.
- + And also on a later date or dates.
- * Amount included in following measurement, time distribution unknown.
- // Gage is equipped with a windshield
- 6 Station not equipped with recording gage, see Table 4 for 6-hourly measured amounts.
- AR This entry in time of observation column in the Station Index means after rain.
- E Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
- M One or more days of record missing; see Table 5 for detailed daily record. Degree day data, if carried for this station, have been adjusted to represent the value for a full month.
- R Daily values and monthly total from recording gage. All other data in Table 3 are from non-recording gages.
- S Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the June issue of this publication.
- SS This entry in time of observation column in the Station Index means sunset.
- T Trace, an amount too small to measure.
- V Includes total for previous month

Subscription Price: 15 cents per copy, monthly and annual; $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks, postal notes and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington, D. C.

NEW ENGLAND - FEBRUARY 1951

W. H. Tracy, Section Director - Boston, Mass.

WEATHER SUMMARY

The coldest day of the winter on January 31 was followed within twenty-four hours by a heavy snowfall, a warm rain, and record high temperatures. At Eastport, Me., the record high temperature for the month was again exceeded, as it was in December last. This is the fifth successive month that has opened with a warm front transit that brought record or near-record high readings.

The 3 to 5-inch snow which fell in southern New England and the 6 to 10-inch fall in northern New England upon an ice base made extremely hazardous travel conditions. In some southern New England areas ice 1.5 inches in diameter formed on wires, stalling trackless trolleys. At least four storm-caused deaths were reported. In Boston hospitals alone more than one hundred persons were treated for injuries. In the night following the 1st however, a dynamic surge of warm, moist tropical air swept northward east of the storm center, which by then was moving northeastward through New York and northern New England. The sudden transition to a warm rain at once began to reduce the snow cover. Most of the Section was enveloped in the warm sector as the center of the depression passed northeastward over the interior highlands. Two days later an energetic storm passed northward off the coast, bringing extremely heavy snowfall to Nantucket and Cape Cod and Rhode Island, but affecting other parts of the Section but little. Nantucket had a fall of 15.9 inches of snow; Greenville, R. I., 15.4 inches, and Hyannis, 12.0 inches.

On the morning of the 7th a deep low pressure trough stretched from Florida to Quebec. At its southern extremity, in the Appalachian Highlands, there was a circulatory development, which moved with great rapidity and increasing intensity up through New England, now again in the warm and wet sector of a vigorous disturbance. Gales battered the entire Section, with heavy rains at night, generally one to two-inch amounts. The moderate snow-depths that had accumulated during the night of the 3-4th were quickly washed away or much diminished. Wind gusts attained velocities of 50 to 87 MPH from the southwest, the latter reported as the peak rate at Blue Hill, Mass. Rivers rose to high levels and ice-jams caused some local flooding, as in the lower Androscoggin Valley. Maine was especially hard hit by the gale-driven tide and surf. From the Penobscot River and Bay eastward fish plants, wharves and other shore property took a terrific pounding. At Brewer the 60-mile gale ripped off the roof of a big chicken brooder, killing 3,000 broilers-loss $7,000. At Robinston a sardine factory was blown and washed into the nearby St. Croix River-loss $300,000. At Eastport an estimated $50,000 worth of damage was done, chiefly to water front property and coastal installations. Two planes at the Airport were wrecked, a 60-foot chimney was levelled. It was the strongest gale of record there in any February, with fastest mile at 57 MPH rate, from the south, and gusts much higher. Inland the blow was fully as severe, the Old Town CAA station reporting a 60 MPH rate, gusts to 85. At Waterville there was a death ascribed to storm exposure. At Millbridge a landmark, "The Acre", was destroyed with a $2500 loss. Though coastal areas suffered most there was widespread havoc wrought inland through Penobscot, Aroostook and Washington counties, even to the northernmost parts. Presque Island had 1600 telephones out of commission, Bangor 800, and similar impairment of service afflicted all communities. The total damage from wind, rain and high water, both river and tidal, was more than half a million dollars. Indicative of the intensification of the cyclonic system is the fact that the center was west of Boston about midnight of the 7th with barometer reading 986mbs (29.12 inches), and deepened to 976mbs (28.83) when it reached northern Maine, and to 967mbs (28.67) at 7:30 p.m., of the 8th in central Labrador. Within 48 hours pressure rose more than 70mbs, or two inches, as a great mass of Arctic air moved in with a cold wave that began to overspread the Section during the night of the 8th, culminating a minima 15 to 35° below zero in extreme northern parts and sub-zero most everywhere. The accompanying northwest gales drove the piercing cold, occasioning much hardship. Signs and other structures, weakened by the previous southerly gales succumbed to stresses from another quarter.

On the week-end of the 10-11th a minor storm development off the coast caused some very dry, fluffy snowfall in the Southern Division. Though of little energy it was responsible for a large number of skidding accidents, and at least five fatalities due to weather. Springlike mildness followed on the 12-13th, breaking date records, and at some stations, as at Portland, Me., the absolute high record for February. Maxima in the Southern Division reached 60° or more, and exceeded 50° in the north. Thenceforth to the end of the month Canadian air invasions were infrequent and without vigor. The persistent mildness affected the monthly average to the extent of making it the warmest February since 1937. At the Section Center it has been exceeded only in 1925 in a record that dates from 1840, considering Weather Bureau and other sources. Average total precipitation was the heaviest for February since 1920. The warmth, combined with copious precipitation, caused rather heavy runoff, but good percolation, and at the end of the month water in storage and ground water were well above normal, compensating now and in the future for the rather light snow cover in the headwaters of the principal rivers.

The average monthly temperature for the Section was 27.6 which is 4.9 above the mean for the past 64 years. The highest monthly average reported was 36.0° at Providence, R. I. the lowest 15.2° at Caribou, Me. The highest temperature reported was 67° at Clinton, Mass. on the 13th: the lowest -41° at Lac Frontiere, Me. on the 9th. The average monthly precipitation, based upon the records of 153 stations was 4.56 inches, which is 1.50 inches more than the average for the past 64 years. The greatest monthly amount reported was 8.40 inches at Dublin, N. H.; the least was 2.57 inches at Bethlehem, N. H. The greatest amount in any observational day was 3.73 inches at Machias, Me., on the 8th. The average snowfall for the Section was 12.6 inches, which is 3.9 inches less than the average for the past 64 years. M.T.N.

THE WINTER OF 1950-1951

The tax on heating systems and highway departments and all human efforts to mitigate the rigors of winter is, of course, most heavy from December through February. When these crucial months pass with less than the ordinary demands there are divers effects upon our economy.

New England has just experienced another such mild season, the third in succession, in which the sting of cold, the burden of snow and the severity of gales have been tempered to a marked degree, though other parts of the country have suffered some of the worst that Nature could impose. These three mild winters might influence fuel dealers and other agencies marketing cold season goods or services to base future operations upon recent experience and thus find themselves ill-prepared to meet the demands of a severe or even a normal winter.

In New England the average temperature for the three months was 27.4°, a figure that has been exceeded but 8 times in the past 63 years. However, there have been but two groups of three successive years with a higher mean, 1930-33 and 1889-92. It is not the purpose here to argue the diminishing severity of our winters, a thesis now accepted by many climatologists. Regardless of the trend, it is nevertheless necessary to go back 62 years to find the highest three-year average. Moreover, the heaviest snow winter was not back in grandpa's day, but only three years ago.

The following table sets forth a comparison of the winter elements in this season and other seasons, recent or outstanding:

	Average Temp.	Depart from Normal	Precip. Monthly Total	Depart from Normal	Snowfall Monthly Total	Depart from Normal	Degree Days. (computed
December,1950	28.7°	+2.3°	4.22 ins	+0.89	8.3 ins.	- 2.9ins	1125
January, 1951	26.0	+3.5	2.99	-0.43	11.9	- 3.8	1209
February, 1951	27.6	+4.9	4.56	+1.50	12.6	- 3.9	1047
Winter,1950-51	27.4	+3.5	11.77	+1.96	32.8	-10.6	3384
Winter,1949-50	26.2	+2.4	9.61	-0.18	40.9	- 2.5	3492
Winter,1948-49	28.3	+4.4	10.66	+0.87	36.7	- 6.7	3303
Winter,1947-48	19.6	-4.3	8.04	-1.75	67.3	+24.1	4086
Coldest winter, (1917-18)	16.2	-7.7	8.27	-1.52	49.4	+ 6.0	4392
Warmest winter, (1889-90)	30.9	+7.0	9.65	-0.14	23.5	-19.9	3069
Normal Winter	23.9	--	9.79	--	43.4	--	3699

In the first nine weeks of the season there was a marked absence of outstanding general snowstorms. The winter sports season was belated, brief and unsatisfactory throughout. The natural ice harvest was short, sub-normal in quantity and quality, with much unfavorable cutting weather. In northern New England a five to 12-inch snowfall, on December 29th, afforded a beginning of winter recreational activities, shortly curtailed by subsequent thaws. On the night of January 7-8th all the Section was blanketed by 4 to 9 inches, but this too vanished in a few days. In some of the mountain notches and in the extreme north, of course, there was little melting, and there were more or less steady increments to depths of twenty or more inches. On February 1st a 3 to 5 inch snowstorm covered the Southern Division, with double those depths in the Northern Division- this on an ice base which made especially dangerous highway conditions. In fact, such ice and glaze hazards were more characteristic of this season than the burden of snow. Peculiarly, the conspicuous snowstorm of the winter was on February 3-4th in the extreme southeast corner of the Section, when Nantucket was burdened with 15.9 inches; Greenville, R. I., 15.3 inches, and Hyannis, 12 inches. Other parts of the Section were little affected. On rare occasions, as in this instance, coast-skirting storms pass at just the right distance off-shore, with temperature at the critical point, to place southeastern Massachusetts in the sector of maximum snowfall. Conversely, some of the heaviest snowstorms of the interior, commonly those with low pressure centers passing to the north, give rain only or a wet mixture on the southeast coast.

Frost penetration in the Southern Division, despite the long intervals without a snow blanket, was much less than usual, and there were periods in which the ground was entirely unfrozen. The frequent warm winds, losing little of their heat, tempered the sharpness of the following cold air invasions. On several days in each winter month new date records for high temperature were set. This occurred six times at the Section Center. At Eastport, Me., the 60° maximum on the 5th of December was the highest of record in a winter month at that station in its 77-year existence. In February, on the 1st, a new high record for the month was set with 54°. Strangely, the December reading was at daybreak and the February maximum near midnight. At Portland, Me., with 60°, and Keene, N. H., with 58°, new high records for February were set, representative of what occurred in many parts of the Section. At the other end of the scale there were such minima as -47° at Lac Frontiere, Me., on January 31, and -36° at First Connecticut Lake, N. H., on February 11, and -35° at Enosburg Falls, Vt., on February 10, all lower than the lowest reported on Mt. Washington Summit, which was -33° on February 8.

Favorable conditions of soil moisture and water resources prevailed at the end of the winter.

M.T.N.

ACKNOWLEDGMENTS

In addition to the climatological data from some 6,000 Weather Bureau and cooperative weather stations, this bulletin series contains records from Hydroclimatic Network Stations which were formerly reproduced in the Hydrologic Bulletin Series. The Hydroclimatic Network is a nationwide net of rain gages--mostly of the recording type which produce continuous records of precipitation. It was established in 1939 at the request of the Corps of Engineers, Department of the Army, to supplement existing precipitation stations in order to provide records of rainfall intensity which were essential to the planning of flood control and related works by the Corps of Engineers. This Network, now numbering about 2,000 recording, and 1,000 non-recording rain gages, has been maintained by the Weather Bureau through working funds transferred annually to the Weather Bureau by the Corps of Engineers. These transfers averaged about $250,000 per year between 1940 and 1944, and nearly $375,000 since that date. For the years 1940-42, the Department of Agriculture transferred about $100,000 per year to provide data required in its work, and since 1947 the Bureau of Reclamation has transferred about $25,000 per year to meet the increasing needs of their program in the Western States.

Previous to the introduction of this bulletin series, data from Hydroclimatic Network stations were presented in bulletins (Hydrologic Bulletins) which were issued monthly for each of 8 drainage areas embracing the entire United States, but since the Network was established to meet the internal requirements of the Federal agencies referred to above, no provision was made for public dissemination of the data, distribution being limited to cooperating agencies and to certain public repositories. A list of locations where reference copies of the Hydrologic Bulletin Series are available for inspection may be obtained upon application to Chief, U. S. Weather Bureau, Washington 25, D. C.

Many other records published in this bulletin have been made available through the cooperation of various public offices, private agencies, and individuals as listed in the Station Index.

REFERENCE NOTES

The four digit identification numbers in the index column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the above table are in local Standard Time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue

Unless otherwise indicated, dimensional units used in this bulletin are: Temperatures in °F, precipitation and evaporation in inches, and wind movement in miles. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning with July 1948.

Amounts in Table 4 are from recording gages Traces are not shown

Amounts in Table 3 are from non-recording gages, unless otherwise indicated.

Data in Tables 3, 5, 6, and snowfall data in Table 7 are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 7:30 P.M. E.S T.

- - No record in Tables 3 4, 6, 7 and the Station Index. No record in Tables 2 and 5 is indicated by no entry When hourly precipitation is missing or accumulated for several days only the first and last days are shown in Table 4.
- ✚ And also on a later date or dates
- • Amount included in following measurement, time distribution unknown.
- Gage is equipped with a windshield
- 6 Station not equipped with recording gage, see Table 4 for 6 hourly measured amounts.
- AR This entry in time of observation column in the Station Index means after rain.
- E Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall
- M 1 to 9 days of record missing. See Table 5 for detailed daily record. Degree day data, if carried for this station, have been adjusted to represent the value for a full month.
- R Daily values and monthly total from recording gage All other data in Table 3 are from non-recording gages
- S Storage precipitation station Precipitation measurements, made at irregular intervals, will be published in the June issue of this publication
- SS This entry in time of observation column in the Station Index means sunset.
- T Trace an amount too small to measure.
- V Includes total for previous month

Subscription Price: 15 cents per copy, monthly and annual, $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks, postal notes and money orders should be made payable to the Treasurer of the United States Remittances and correspondence regarding subscription should be sent to the Superintendent of Documents Government Printing Office, Washington, 25 D. C.

NEW ENGLAND - MARCH 1951

W. H. Tracy, Section Director - Boston, Mass.

WEATHER SUMMARY

Consistent with the anomalies that have dominated weather conditions in New England since last November, March was mild both as to temperature and storminess. It was rather wet except over the extreme north. Some stations in northern Maine received only 1.50 inches or less of precipitation, in sharp contrast with six times that amount in Portland. In southern New England the largest amounts were recorded west of the Connecticut River, many stations reporting more than six inches, a few over eight inches, and one, in Connecticut, nine inches. No storm was of great energy, but that of the 13th brought the excessive rains to western Maine, and that of the 30-31st deluged Connecticut. Minor local floods ensued, particularly in the Housatonic, Farmington and Naugatuck Rivers. The ground being thoroughly saturated and its absorptive capacity reduced to a minimum all precipitation went to swell the streams as the heavy rains coincided with thawing of ice and snow in the upper reaches. Highway inundation was a common inconvenience to many river towns. In southern Vermont there were serious washouts.

During the month there were frequent light to moderate snowfalls in the Northern Division, enough to enable winter recreational activities to operate, but in the Southern Division east of the Berkshires and southernmost parts of the Northern Division monthly totals were only two to seven inches. The winter sports activities were able to recoup some of their early season losses, but their season has been short at the best and generally unsatisfactory as were the two preceding winters. In the final week no snow lay upon the ground except on the mountains and in some of the notches, and even there less than the usual amount was impounded for spring melt. Thanks to the copious precipitation in four of the last five months ground water levels remained high, stream-flow generally well above normal, and reservoirs well-filled. The shortages of water for domestic supply, so acute last fall in many communities, are no longer critical problems. The development of new sources of supply, activated by last fall's drought, which was most serious in Essex County, Mass., still goes forward as planned. A few dry months could, of course, nullify the gains, uninterrupted since last November. There was much more than the usual amount of cloudiness, and, conversely, an extremely low percentage of sunshine was recorded at the first order stations where instrumental records are kept. At Boston and Blue Hill, Mass., the percentages of sunshine 41 and 30%, respectively, were the lowest recorded in March in over sixty years.

The Section average temperature, based upon the records of 159 stations, was 34.0°, which is 1.7° above the mean for the past 64 years. The highest monthly mean reported was 40.9° at New London, Connecticut, the lowest was 23.5° at First Conn Lake, New Hampshire. The highest recorded was 72° at Lake Cochituate, Mass., on the 29th; the lowest -24° at Fort Kent, Maine, on the 1st. The average precipitation for the Section, based upon the records of 157 stations was 4.64 inches, which is 1.05 inches more than the mean for the past 64 years. The greatest monthly amount reported was 9.38 inches at Putnam Lake, Connecticut; the least 1.24 inches at Presque Isle, Maine. The greatest amount in 24 hours was 3.65 inches at Wolcott Reservoir, Connecticut, on the 31st. The average snowfall for the Section was 9.5 inches, which is 1.7 inches less than the mean for the past 64 years. -- M.T.N.

ACKNOWLEDGMENTS

In addition to the climatological data from some 6 000 Weather Bureau and cooperative weather stations, this bulletin series contains records from Hydroclimatic Network Stations which were formerly reproduced in the Hydrologic Bulletin Series. The Hydroclimatic Network is a nationwide net of rain gages--mostly of the recording type which produce continuous records of precipitation. It was established in 1939 at the request of the Corps of Engineers, Department of the Army, to supplement existing precipitation stations in order to provide records of rainfall intensity which were essential to the planning of flood control and related works by the Corps of Engineers. This Network, now numbering about 2,000 recording, and 1,000 non-recording rain gages, has been maintained by the Weather Bureau through working funds transferred annually to the Weather Bureau by the Corps of Engineers. These transfers averaged about $250,000 per year between 1940 and 1944, and nearly $375,000 since that date. For the years 1940-42, the Department of Agriculture transferred about $100,000 per year to provide data required in its work, and since 1947 the Bureau of Reclamation has transferred about $25,000 per year to meet the increasing needs of their program in the Western States.

Previous to the introduction of this bulletin series, data from Hydroclimatic Network stations were presented in bulletins (Hydrologic Bulletins) which were issued monthly for each of 8 drainage areas embracing the entire United States, but since the Network was established to meet the internal requirements of the Federal agencies referred to above, no provision was made for public dissemination of the data, distribution being limited to cooperating agencies and to certain public repositories. A list of locations where reference copies of the Hydrologic Bulletin Series are available for inspection may be obtained upon application to Chief, U.S. Weather Bureau, Washington 25, D. C.

Many other records published in this bulletin have been made available through the cooperation of various public offices, private agencies, and individuals as listed in the Station Index.

REFERENCE NOTES

The four digit identification numbers in the index column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the above table are in Local Standard Time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperatures in °F, precipitation and evaporation in inches, and wind movement in miles. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1 beginning with July 1948.

Amounts in Table 4 are from recording gages. Traces are not shown.

Amounts in Table 3 are from non-recording gages, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall data in Table 7 are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 7:30 P.M. E.S.T.

- No record in Tables 2, 3, 5, 6, 7 and the Station Index. No record in Tables 2 and 4 is indicated by no entry. When used, precipitation is missing or accumulated for several days only the first and last days are shown in Table 4.
- * And also on a later date or dates.
- • Amount included in following measurement; time distribution unknown.
- a Gage is equipped with a windshield.
- d Station not equipped with recording gage. See Table 4 for [illegible] measured amounts.
- [illegible] [illegible] time of observation column in the Station Index means [illegible].
- r Water equivalent of snowfall wholly or partly estimated using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
- M [illegible] days of record missing. See Table 5 for detailed daily record. Degree day data [illegible] for this station have been adjusted to represent the value for a full month.
- H Total value and partial total from recording gage. All other data in Table 3 are from non-recording gages.
- C [illegible] precipitation measurements made at irregular intervals will be published in the June issue of this publication.
- SS This entry in time of observation column in the Station Index means sunset.
- T Trace, an amount too small to measure.
- ‡ Includes total for previous month.

Subscription Price: 15 cents per copy, monthly and annual; $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

NEW ENGLAND

APRIL 1951
Volume LXIII No. 4

CHATTANOOGA: 1951

NEW ENGLAND - APRIL 1951

W. H. Tracy, Section Director - Boston, Mass.

WEATHER SUMMARY

For seven consecutive months, including April, 1951, New England has experienced temperatures substantially above normal. Only three similar periods since the turn of the century have been warmer, those in 1912-13, 1920-21, and 1948-49. In eastern Maine the average temperature was close to the high record for April. At Eastport, Me., it exceeded all previous April means since the official record began in 1873. The high averages were not due to warm days, which were rare, but to a lack of low minima. The daily mean temperatures were above normal all over the Section on all but three or four days. The snow cover receded and northern waters became ice-free somewhat earlier than usual. Not until the latter half of the month, however, could general field work proceed in the Northern Division because cloudiness retarded the drying of soils. On the whole the spring weather was not favorable for maple sugar production, either as to quantity or quality.

In five of these seven warm months, precipitation was more than normal, the total excess from November through April having amounted to 6.66 inches. Thus there has been maintained a satisfactory water supply situation, eliminating the distresses occasioned by droughts of the last two years. These augmented reserves were acquired without any major flood, although there was a protracted spring freshet period. At Hartford, Conn., the Connecticut River, boosted by the heavy general rains of the 2-3d, was above flood stage for the first 18 days of the month. From two to nearly three inches of rain fell in eastern Connecticut in this storm, and elsewhere from one and a half to two inches. The spring runoff was at its height in this first week, causing the usual lowland flooding. Highways were inundated in many places. The Berkshire Region had a late-season heavy snowstorm, with amounts up to five inches in the towns, and eight inches or more on the Mohawk Trail. The Hoosatonic River claimed a victim in its swirling waters. At Haverhill, Mass., it was necessary to operate the pumping station to avert stock damage in the business section, the Merrimack River being so swollen from heavy rains up the Valley. However, despite what had been a serious threat from heavy rain and snow-melt, the stream flow was so distributed as to end the menace after a few dry days.

During the period from the 7th to 16th there were almost daily outbreaks of frontal showers generating on cold fronts thrown off from a stationary low pressure area over the Ohio Valley and Lake Region. Some thunderstorm activity was reported at numerous times and places. None was especially severe, though central New Hampshire suffered minor local damage on the 15th. The squalls which swept eastward across Massachusetts and the southern parts of the Northern Division that Sunday caused peak gusts of 50 to 59 mph rate. Tree limbs snapped wires and several communities were without electric service for hours. In Newbury, Mass., a large barn was levelled and debris widely scattered. There were many small boat upsets. Two persons drowned in Long Island Sound off Norwalk, Conn. Hail was reported at various times and places on the 11th, 13th, 14th, 15th and 17th, though none was of destructive intensity. At Collinsville, Conn., on the 13th stones as large as marbles were reported, and on the same date hail was reported at many stations in all six states of the Section.

Two major storms occurred later, one on the 23d in the Southern Division, and one on the 26th in the Northern Division, both bringing rather heavy rains. The month ended, however, with five sunny dry days, with relative humidity as low as 13% on the afternoon of the 30th. This quickly effected the development of a serious forest fire hazard.

The Section mean temperature, based upon the records from 154 stations, was 46.1°, which is 2.4° above the average of the past 64 years. The highest monthly mean reported was 52.6° at Waterbury City Hall, Conn., the lowest 38.1° at First Connecticut Lake, N.H. The highest temperature reported was 83° at Greenwich, Conn., the lowest 10° at Lac Frontiere, Me., on the 5th. The average monthly precipitation, based upon the records of 156 stations, was 4.11 inches, which is 0.76 inch more than the average for the past 64 years. The greatest monthly amount reported was 7.64 inches at Rumford, 3 SW, Me., the least 1.61 inches at New Bedford, Mass. The greatest amount in any observational day was 2.53 inches at Norwich, Conn., on the 3d. -- M.T.N.

ACKNOWLEDGMENTS

In addition to the climatological data from some 6,000 Weather Bureau and cooperative weather stations, this bulletin series contains records from Hydroclimatic Network Stations which were formerly reproduced in the Hydrologic Bulletin Series. The Hydroclimatic Network is a nationwide net of rain gages--mostly of the recording type which produce continuous records of precipitation. It was established in 1939 at the request of the Corps of Engineers, Department of the Army, to supplement existing precipitation stations in order to provide records of rainfall intensity which were essential to the planning of flood control and related works by the Corps of Engineers. This Network, now numbering about 2,000 recording, and 1,000 non-recording rain gages, has been maintained by the Weather Bureau through working funds transferred annually to the Weather Bureau by the Corps of Engineers. These transfers averaged about $250,000 per year between 1940 and 1944, and nearly $375,000 since that date. For the years 1940-42, the Department of Agriculture transferred about $100,000 per year to provide data required in its work, and since 1947 the Bureau of Reclamation has transferred about $25,000 per year to meet the increasing needs of their program in the Western States.

Previous to the introduction of this bulletin series, data from Hydroclimatic Network stations were presented in bulletins (Hydrologic Bulletins) which were issued monthly for each of 8 drainage areas embracing the entire United States, but since the Network was established to meet the internal requirements of the Federal agencies referred to above, no provision was made for public dissemination of the data, distribution being limited to cooperating agencies and to certain public repositories. A list of locations where reference copies of the Hydrologic Bulletin Series are available for inspection may be obtained upon application to Chief, U.S. Weather Bureau, Washington 25, D. C.

Many other records published in this bulletin have been made available through the cooperation of various public offices, private agencies, and individuals as listed in the Station Index.

REFERENCE NOTES

The four digit identification numbers in the index column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the above table are in local Standard Time.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

[illegible] data and corrections will be carried only in the June and December issues of this bulletin.

[illegible] in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

[illegible] dimensional units used in this bulletin are: temperatures in °F, precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a [illegible] of 65° F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

[illegible] were included in snowfall averages in Table 1, beginning with July 1948.

[illegible] are from recording gages. Traces are not shown.

[illegible] from non-recording gages, unless otherwise indicated.

[illegible] and snowfall data in Table 7 are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 7:30 P.M. E.S.T.

[illegible] 1, 6 [illegible] the Station Index. No record in Tables 2 and 5 is indicated by no entry. When hourly precipitation is missing or accumulated for several days only [illegible] shown in Table 4.

† [illegible] not used in computing averages or extremes for State or Section
[illegible]
[illegible] measurement, time distribution unknown
[illegible]
[illegible] able 4 for 6 hourly measured amounts
[illegible] Station Index mean after rain
[illegible] using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
W [illegible] daily record. Degree day data, if carried for this station, have been adjusted to represent the value for a full month.
F [illegible] from recording gage. All other data in Table 2 are from non-recording gages.
[illegible] precipitation measurements, made at irregular intervals, will be published in the June issue of this publication
[illegible] Station Index means sunset
T [illegible]
[illegible] total for previous month

[illegible] $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Treasurer of the United States. [illegible] regarding subscription should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

CHATTANOOGA: 1951

NEW ENGLAND - MAY 1951

W. H. Tracy, Section Director - Boston, Mass.

WEATHER SUMMARY

The average temperature for the Section was, like that of the seven preceding months, above the normal. In May, however, the excess was less than in any of the other months. In the past thirty years there has been no corresponding 8-month period that was warmer except in 1948-9. These are the months when occupied buildings normally require artificial heat continuously. As indicated by degree-day figures there have now been three successive heating seasons that were extraordinarily mild. This emphasizes the need for a warning note to fuel dealers and to all other businesses and activities that deal in seasonal goods not to gauge their future requirements upon recent experience lest they find themselves unprepared to cope with the demands of a severe or even a normal season.

Extremely dry air covered New England during the first week of May. On the 2d at the Section Center relative humidity lowered to 8% at 4:58 p. m. This was the lowest of record since the establishment of the station in 1870, and was a close approach to the dryness of the desert air. With the strong north-northwest winds this was highly effective in the drying of wet fields, some of which had been too wet to work, but it likewise dehydrated the forest floor to the point of creating a high hazard in the woodlands. Fires, fanned by the wind, broke out at many points in all six states, but they were mostly confined to small areas. The most serious occurred at Exeter and West Greenwich, R. I., where 5,000 acres of woodland and 6 horses were destroyed. In Winchester, N. H., 1,000 acres and 3 buildings were burned; in South Bridgton, Me., 100 acres; in Lancaster, Mass., 1,800 acres. In Tyngsboro and Weston, Mass., there was considerable loss, and there were minor fires in dozens of other places in central and southern New England. Some became crown fires, the blaze leaping from treetop to treetop, consuming everything above the scorched earth. Following a respite granted by showers on the 6-7th, the danger recurred on the 9th when there were 50 fires in Massachusetts, some in Connecticut and New Hampshire. On the 11th a substantial rainstorm benefited the entire Section. The fire hazard eased, only to return on the 16th, when there were numerous fires in Massachusetts and Connecticut. The most serious was in Reading, Mass., where three square miles of woodland burned, including half of the Town Forest, several poultry houses and an orchard. In Maine the numerous fires were well contained, but near Augusta a house and barn were destroyed. The 16th also marked the first heat wave of the season, maximum temperatures attaining 90° or over in the Southern Division. At Portland, Me., the maximum of 90° was 2° higher than any previous record so early.

Vegetation in general was favored by the near normal month. Germination and growth were satisfactory except for some retarding of distinctly warm weather crops such as cucumbers and beans. Frosts in the first week, especially on the 5th, were too early to do much harm, but on the 14th in central areas there was some damage, while on the 18-19th all inland districts were subjected to a severe set-back by heavy to killing frosts in susceptible localities. The tender seedlings of such early plantings as corn and fancy tomatoes were lost in Connecticut, where not blanketed by smudge fires. In southern parts of the Northern Division there was severe damage to fruit buds.

Few storms of destructive proportions were reported. Strong northwest to north winds on the 2d did some tree and wire damage in the Northern Division. Wind-squalls accompanied thunderstorms on the 22d, 23d, 24th, and 28th in scattered localities. The northeast wind which swept southeastern coastal areas on the 24th attained gale velocity in the gusts and kicked up heavy seas. The swamping of a 50-foot Navy Launch loaded with about 142 men, 19 of whom were drowned, was partly attributable to this storm, which was a coastal development on a very slow moving cold front. The attendant prolonged rainfall produced totals of over two inches at many places in southern New England, more than three inches in Norfolk County, and the northern part of Plymouth County. Beechwood, Mass., reported a total of 4.56 inches in the three days 23-25th. With the above exceptions May was rather a quiet month as to windiness. Electrical storm casualties were light. At South Acton, Mass., on the 28th a house was struck and damaged to the extent of $10,000. Wire services of the town and of the Boston and Maine Railroad signalling system were inoperative for a few hours.

The moderate to heavy rains over most of the Section on the 23-24th and again on the 27-28th conditioned soil moisture by the end of the month to the great benefit of crops in general and of grasses in particular.

Storage and ground-water supplies continued somewhat above normal, while stream flow declined steadily except during and after the heavy rains of the last week.

The Section mean temperature, based upon the records of 156 stations, was 55.9° which is 0.7 above the average for the past 64 years. The highest monthly mean reported was 62.2° at Springfield, Mass. The lowest monthly mean reported was 48.2° at First Connecticut Lake, N. H. The highest temperature reported was 94° at Wilder, Vt. on the 16th; the lowest was 20° at several stations on the 1st and 4th. The average monthly precipitation, based upon the records of 159 stations, was 3.51 inches, which is 0.05 inches above the average for the past 64 years. The greatest monthly amount reported was 7.12 inches at Beechwood, Mass.; the least monthly amount reported was 1.37 inches at Fort Fairfield, Me. The greatest amount in 24 hours was 3.40 inches at Beechwood, Mass., on the 24th. A few snow squalls were reported in mountainous parts of northern New England on the 3d, 4th, 11th and 24th, generally in amounts not measurable. On Mt. Washington Summit, however, 4 inches fell on the 24th, and at the Searsburg Mountain Station, Vt., 1.0 inch on the 11th. Other frozen precipitation was confined to light scattered hail accompanying thunderstorms in several parts of the Section. - M.T.N.

ACKNOWLEDGMENTS

In addition to the climatological data from some 6,000 Weather Bureau and cooperative weather stations, this bulletin series contains records from Hydroclimatic Network Stations which were formerly reproduced in the Hydrologic Bulletin Series. The Hydroclimatic Network is a nationwide net of rain gages--mostly of the recording type which produce continuous records of precipitation. It was established in 1939 at the request of the Corps of Engineers, Department of the Army, to supplement existing precipitation stations in order to provide records of rainfall intensity which were essential to the planning of flood control and related works by the Corps of Engineers. This Network, now numbering about 2,000 recording, and 1,000 non-recording rain gages, has been maintained by the Weather Bureau through working funds transferred annually to the Weather Bureau by the Corps of Engineers. These transfers averaged about $250,000 per year between 1940 and 1944, and nearly $375,000 since that date. For the years 1940-42, the Department of Agriculture transferred about $100,000 per year to provide data required in its work, and since 1947 the Bureau of Reclamation has transferred about $25,000 per year to meet the increasing needs of their program in the Western States.

Previous to the introduction of this bulletin series, data from Hydroclimatic Network stations were presented in bulletins (Hydrologic Bulletins) which were issued monthly for each of 8 drainage areas embracing the entire United States, but since the Network was established to meet the internal requirements of the Federal agencies referred to above, no provision was made for public dissemination of the data, distribution being limited to cooperating agencies and to certain public repositories. A list of locations where reference copies of the Hydrologic Bulletin Series are available for inspection may be obtained upon application to Chief, U.S. Weather Bureau, Washington 25, D. C.

Many other records published in this bulletin have been made available through the cooperation of various public offices, private agencies, and individuals as listed in the Station Index.

REFERENCE NOTES

The four digit identification numbers in the index column of the Station Index are assigned on a state basis There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the above table are in local Standard Time

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: temperatures in °F, precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65°F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning with July 1948.

Amounts in Table 4 are from recording gages. Traces are not shown.

Amounts in Table 3 are from non-recording gages, unless otherwise indicated.

Data in Tables 3, 5, 6, and snowfall data in Table 7 are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 7:30 P.M. E.S.T.

- - No record in Tables 3, 4, 6, 7 and the Station Index. No record in Tables 2 and 5 is indicated by no entry. When hourly precipitation is missing or accumulated for several days only the first and last days are shown in Table 4.
- † Mount Washington WB, New Hampshire not used in computing averages or extremes for State or Section.
- + And also on a later date or dates.
- * Amount included in following measurement, time distribution unknown.
- // Gage is equipped with a windshield.
- 6 Station not equipped with recording gage, see Table 4 for 6-hourly measured amounts.
- AR This entry in time of observation column in the Station Index means after rain.
- E Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
- M 1 to 9 days of record missing; See Table 5 for detailed daily record. Degree day data, if carried for this station, have been adjusted to represent the value for a full month.
- R Daily values and monthly total from recording gage. All other data in Table 3 are from non-recording gages.
- S Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the June issue of this publication.
- SS This entry in time of observation column in the Station Index means sunset.
- T Trace, an amount too small to measure.
- V Includes total for previous month.

Subscription Price: 15 cents per copy, monthly and annual; $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscription should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

NEW ENGLAND - JUNE 1951

W. H. Tracy, Section Director - Boston, Mass.

WEATHER SUMMARY

The Section average temperature in June, as in May, deviated but slightly from normal. Precipitation was a little above normal at the Section Center and at a few scattered stations in various inland locations, but there were several dry areas, notably in southeastern Massachusetts where monthly totals dwindled below the Cape Cod Canal to less than an inch. It was the first month since January with rainfall deficiency for the Section.

Hot, sunny weather during the first four days gave stimulus to vegetation, and early produce came to market in good volume and quality. Invasions of polar air from the 5th to the 9th depressed temperatures, particularly on the 8th, to minima near 30° in the extreme north and to the 40's elsewhere. Coastal regions were subsequently cooled much of the time by onshore winds and the cloudiness which prevailed on many days slowed plant growth somewhat. Showers were frequent and copious, affording scant opportunity to cut and store the fine hay crop. Because of the lack of any extended hot period there was not the full development of summer recreational activities. Another deterrent factor in this respect was the preponderance of cold, rainy weekends. These discouraged pleasure travel not only in the current season but during the last seven and a half months. Since the 12th of November no weekend was without at least a trace of precipitation, while in twenty-four out of the thirty-three Saturday-Sunday periods there were measurable amounts. Summer merchandise moved slowly, summer reservations and rentals lagged to the detriment of all warm-season resort interests as well as to the purveyors of seasonal goods.

Although there were no heavy gales, strong easterly winds for several days created rough seas. These were a contributing factor in a disaster on Sunday, June 10, to the 35-foot fishing party boat "The Jack", which apparently struck a submerged object in Block Island Sound and sank suddenly in the heavy wind-swept seas, with the loss of thirteen lives. Three other Connecticut craft were disabled and one sank in the storm.

On the 17th there were showers and thunderstorms of destructive energy at a number of places in eastern Massachusetts, with local damage reported in Chelsea, Everett and Medford, while in Wakefield more than 2,000 homes were without electricity for four hours. Scores of trees in the Greater Boston area were uprooted. At Somerset, Mass., lightning struck the Modern Dairy three times in less than a minute. Flames swept the plant to the extent of $20,000 damage. A little later in the evening a violent electrical storm ravaged the northern half of Rhode Island, doing similar local wind damage in addition to some by heavy hail. Another hailstorm, violent but strictly local, occurred in Sturbridge, Mass., on the following day, breaking windows and sending residents to cover as half-inch stones fell for several minutes. Generally, more than half of the month's total precipitation was in this period, although frequent light to moderate rains fell several times in the last decade.

Soil moisture was adequate and most crops showed a healthy though rather slow growth.

The Section mean temperature, based upon the records from 153 stations, was 62.8° which is 1.2° below the average for the past 64 years. The highest monthly mean temperature reported was 69.7° at Waterbury City Hall, Conn.; the lowest was 56.1° at Pinkham Notch, N.H. The highest temperature reported was 92° at several stations on the 1st; the lowest 29° at Dorset, Vt., and West Cummington, Mass. on the 8th.

The average monthly precipitation for the Section was 2.86 inches, which is 0.65 inch less than the average for the past 64 years. The greatest monthly amount reported was 6.30 inches at Searsburg Station, Vt.; the least 0.43 inch at North Truro, Mass. The greatest amount in 24 hours was 2.26 inches at Athol, Mass., on the 15th. -- M.T.N.

ACKNOWLEDGMENTS

In addition to the climatological data from some 6,000 Weather Bureau and cooperative weather stations, this bulletin series contains records from Hydroclimatic Network Stations which were formerly reproduced in the Hydrologic Bulletin Series. The Hydroclimatic Network is a nationwide net of rain gages--mostly of the recording type which produce continuous records of precipitation. It was established in 1939 at the request of the Corps of Engineers, Department of the Army, to supplement existing precipitation stations in order to provide records of rainfall intensity which were essential to the planning of flood control and related works by the Corps of Engineers. This Network, now numbering about 2,000 recording, and 1,000 non-recording rain gages, has been maintained by the Weather Bureau through working funds transferred annually to the Weather Bureau by the Corps of Engineers. These transfers averaged about $250,000 per year between 1940 and 1944, and nearly $375,000 since that date. For the years 1940-42, the Department of Agriculture transferred about $100,000 per year to provide data required in its work, and since 1947 the Bureau of Reclamation has transferred about $25,000 per year to meet the increasing needs of their program in the Western States.

Previous to the introduction of this bulletin series, data from Hydroclimatic Network stations were presented in bulletins (Hydrologic Bulletins) which were issued monthly for each of 8 drainage areas embracing the entire United States, but since the Network was established to meet the internal requirements of the Federal agencies referred to above, no provision was made for public dissemination of the data, distribution being limited to cooperating agencies and to certain public repositories. A list of locations where reference copies of the Hydrologic Bulletin Series are available for inspection may be obtained upon application to Chief, U.S. Weather Bureau, Washington 25, D. C.

Many other records published in this bulletin have been made available through the cooperation of various public offices, private agencies, and individuals as listed in the Station Index.

CORRECTIONS

MONTH: April 1949

Table 2:
Mt. Washington, N. H. — Mean temperature should be 23.3°; departure from normal, -0.1°; lowest temperature, 3° on 24th.

Table 3: — Minimum temperature on 9th should be 12°; mean minimum temperature should be 17.3°.

January 1950 through January 1951

Table 4:
Lyman Falls, Vt. — Name should have been Bloomfield.

MONTH: March 1951

Table 2:
Lawrence, Mass. — Precipitation departure should have been +1.34.

MONTH: April 1951

Table 3: — Pages 111 and 112 should be reversed.

REFERENCE NOTES

The four digit identification numbers in the index column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the above table are in local Standard Time.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: temperatures in °F, precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65 F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning with July 1948.

Amounts in Table 4 are from recording gages. Traces are not shown.

Amounts in Table 3 are from non-recording gages, unless otherwise indicated.

Data in Tables 3, 5, 6, and snowfall data in Table 7 are for the 24 hours ending at time of observation. See the Station Index for observation time

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 7:30 P.M. E.S.T.

- - No record in Tables 3, 4, 6, 7 and the Station Index. No record in Tables 2 and 5 is indicated by no entry. When hourly precipitation is missing or accumulated for several days only the first and last days are shown in Table 4.
- † Mount Washington WB, New Hampshire not used in computing averages or extremes for State or Section
- + And also on a later date or dates.
- * Amount included in following measurement, time distribution unknown.
- Gage is equipped with a windshield.
- 6 Station not equipped with recording gage, see Table 4 for 6-hourly measured amounts.
- AR This entry in time of observation column in the Station Index means after rain.
- E Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
- M 1 to 9 days of record missing. See Table 5 for detailed daily record. Degree day data, if carried for this station, have been adjusted to represent the value for a full month.
- R Daily values and monthly total from recording gage. All other data in Table 3 are from non-recording gages.
- S Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the June issue of this publication.
- SS This entry in time of observation column in the Station Index means sunset.
- T Trace, an amount too small to measure.
- V Includes total for previous month.

Subscription Price 15 cents per copy, monthly and annual; $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscription should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

NEW ENGLAND - JULY 1951

W. H. Tracy, Section Director - Boston, Mass.

WEATHER SUMMARY

The average Section temperature was within a tenth of a degree of normal, and there were no extensive periods of intense heat or unusual cold. Over much of the Southern Division the plus departures were one to two degrees, while in northern parts of Vermont and in northern-interior parts of Maine the averages were a little on the cool side. Precipitation, though fairly well distributed, showed some sharp contrasts in moisture supply. A few Stations in southern Rhode Island and southeastern Massachusetts received less than an inch of rain in the entire month, while an equal number of stations in northern Massachusetts reported from six to more than seven inch totals. Northern New England was rather wet as there were frequent showers, some very heavy. More than half of the Maine stations received in excess of six inches. This made difficult the curing and storing of a good hay crop. In many places standing water prevented farmers from working in their hayfields.

The first entirely pleasant weekend since last November was on the 7-8th, followed by another on the 14-15th. These stimulated the lagging recreational business. Hot weather crops advanced rapidly. In the southeast portion of the Section, however, shortages of precipitation persisted. High humidity and persistent fog tended to render less harsh the drought effects.

There were some mild showers on the 4-5th and on the 11-12th, but storm damage was negligible until a series of electrical disturbances from the 16th through the 19th affected at some time all of the 6-state area except Cape Cod. The first day of this period brought the destruction of some barns in northeastern Connecticut, and a torrential rain to Claremont, N. H., the latter accompanied by winds resembling a "twister". Then on the early morning of the 17th hail fell, some of the stones as large as walnuts, in Suffield, Granby and Thompsonville, Conn., raising havoc with the shade-grown tobacco, while in Rhode Island estimated losses to the extent of $65,000 befell farms that lost buildings, hay, cattle and poultry. On one farm in Foster, 40 head of cattle were destroyed: in Portsmouth 3,000 chickens were killed. Again on the 19th all parts of the Section except the extreme southeast experienced property losses from rain, hail, flood, lightning, fire and wind squalls, to the extimated value of over a million dollars. The largest item was $300,000 damage to shade-grown tobacco in the Connecticut Valley. The human toll was two deaths in Connecticut from lightning stroke, and in Massachusetts seven persons injured. Hundreds of buildings over the Section were more or less damaged by lightning and resultant fires. Livestock was killed in at least two places. At Carlisle, Mass., six Holstein cows were killed and at Methuen, Mass., two cows in their stalls. In the Greater Boston area there were listed thirty strikes on buildings. Some of the heavy precipitation figures were a 5-hour amount of 4.62 inches at Rockland, Me., and 3.60 inches at Clinton, Mass. At Providence, R. I., 1.6 inches fell in a half-hour, and the business streets in that city were flooded as the tide developed back pressure that retarded drain-off. There followed several fine summer days. On the 28th there was a general rain, which served to maintain ground moisture, to the benefit of vegetation. Grasses throve in particular and there was none of the parching so common in recent years, especially in the last two. In consonance with the bounteous distribution of rain, streamflow was above normal except in southeast portions. Reservoir storage continued at high levels.

The average Section temperature, based upon the records from 160 stations, was 69.3°, which is 0.1° above the mean for the past 64 years. The highest monthly average reported was 75.6° at Waterbury City Hall, Conn.; the lowest 61.7° at First Connecticut Lake, N. H. The highest temperature reported was 94° at several stations on the 17th or 26th; the lowest 35° at Lac Frontiere, Me., on the 18th. The average monthly precipitation, based upon the records of 162 stations, was 4.69 inches, which is 0.94 inch above the mean for the past 64 years. The greatest monthly amount reported was 8.13 inches at Ashburnham, Mass., the least 0.56 inch at Bloomfield, Conn. The greatest precipitation in 24 hours was 4.62 inches at Rockland, Me., on the 19th. - M.T.N.

ACKNOWLEDGMENTS

In addition to the climatological data from some 6,000 Weather Bureau and cooperative weather stations, this bulletin series contains records from Hydroclimatic Network Stations which were formerly reproduced in the Hydrologic Bulletin Series. The Hydroclimatic Network is a nationwide net of rain gages--mostly of the recording type which produce continuous records of precipitation. It was established in 1939 at the request of the Corps of Engineers, Department of the Army, to supplement existing precipitation stations in order to provide records of rainfall intensity which were essential to the planning of flood control and related works by the Corps of Engineers. This Network, now numbering about 2,000 recording, and 1,000 non-recording rain gages, has been maintained by the Weather Bureau through working funds transferred annually to the Weather Bureau by the Corps of Engineers. These transfers averaged about $250,000 per year between 1940 and 1944, and nearly $375,000 since that date. For the years 1940-42, the Department of Agriculture transferred about $100,000 per year to provide data required in its work, and since 1947 the Bureau of Reclamation has transferred about $25,000 per year to meet the increasing needs of their program in the Western States.

Previous to the introduction of this bulletin series, data from Hydroclimatic Network stations were presented in bulletins (Hydrologic Bulletins) which were issued monthly for each of 8 drainage areas embracing the entire United States, but since the Network was established to meet the internal requirements of the Federal agencies referred to above, no provision was made for public dissemination of the data, distribution being limited to cooperating agencies and to certain public repositories. A list of locations where reference copies of the Hydrologic Bulletin Series are available for inspection may be obtained upon application to Chief, U.S. Weather Bureau, Washington 25, D. C.

Many other records published in this bulletin have been made available through the cooperation of various public offices, private agencies, and individuals as listed in the Station Index.

REFERENCE NOTES

The four digit identification numbers in the index column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the above table are in local Standard Time.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: temperatures in °F, precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65°F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6

Sleet and hail were included in snowfall averages in Table 1, beginning with July 1948.

Amounts in Table 4 are from recording gages. Traces are not shown.

Amounts in Table 3 are from non-recording gages, unless otherwise indicated.

Data in Tables 3, 5, 6, and snowfall data in Table 7 are for the 24 hours ending at time of observation. See the Station Index for observation time

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 7:30 P.M. E.S.T.

- - No record in Tables 3, 4, 6, 7 and the Station Index. No record in Tables 2 and 5 is indicated by no entry. When hourly precipitation is missing or accumulated for several days only the first and last days are shown in Table 4.
- † Mount Washington WB, New Hampshire not used in computing averages or extremes for State or Section.
- • And also on a later date or dates.
- ° Amount included in following measurement, time distribution unknown.
- Gage is equipped with a windshield.
- 6 Station not equipped with recording gage, see Table 4 for 6-hourly measured amounts.
- AR This entry in time of observation column in the Station Index means after rain
- E Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to [illegible] of new snowfall.
- M 1 to 9 days of record missing. See Table 4 for detailed daily record. Degree day data (if carried [illegible] have been adjusted to represent the value for a full month
- R Daily values and monthly totals from recording gage. All other data in Table 3 are from non-recording gages.
- S Storage precipitation station. Precipitation measurements made at irregular intervals, will be [illegible]
- SS This entry in time of observation column in the Station Index means sunset
- T Trace, an amount too small to measure
- V Includes total for previous month

Subscription Price: 1[illegible] cents per copy, monthly and annual; $1.[illegible] per year. NEW ENGLAND - AUGUST 1951

W. H. Tracy, Section Director - Boston, Mass.

WEATHER SUMMARY

The average Section temperature, as in the previous months of this summer was near normal. The departure was a half-degree on the cool side in the Northern Division, and slightly less in the Southern. There was one really cool period during the first week, particularly around the 5-7th, when minimum readings fell to the low 40's in interior lowlands, and even to the low 30's at some of the mountain valley stations. The lowest midsummer readings of record were reported at a few places in the Merrimac Valley. During the rest of the month seasonable warmth prevailed, but with no excessive heat-not even 90° maxima except at a few stations at the beginning and near the end of the month.

Rainfall in general was slightly in excess of normal. Eastern Maine was too wet for favorable conditions in the potato raising region. The outstanding rainfall excess, however, was at Martha's Vineyard, where the monthly total was 9.82 inches, largely due to a torrential rain on the 8th. During the passage of a squall-line just off the southeast New England coast, 5.42 inches fell at Edgartown. Cellars, streets and lowlands were flooded, brooks flowed in places where they had never been known, but the absence of major streams on the island limited the possibilities for damage. The weather was uneventful until the 15-16th shower period, when many parts of the Section experienced severe electrical storms. Environs of Greater Boston suffered minor local damage on the 15th, and a death from lightning stroke occurred in Brookline. More than 20 buildings were struck. In Wakefield, Mass., power failure or flooding shut down 20 plants and Main St., was closed to traffic. Repeating the attacks the following day, thunderstorms attained wider distribution in central Massachusetts, southern Hampshire County in particular. A child was killed by lightning at Palmer. Tobacco damage in the lower Connecticut Valley was considerable. Again on the 20th, drenching rains, crop damage by hail, and power line suspensions were common to much of southern New England. Dozens of buildings were set afire by lightning, most of them being extinguished, but several were destroyed. These storms of the 20th and the more serious line-squalls and tornadoes of the 21st, the latter described below, were the last active disturbances of the month. The final week was of summer warmth, favoring the maturing of crops. A real deterrent to vacationists this month was the unusual prevalence of fog, reported on 23 days in some part of the Section - as ground fog inland, and sea fog alongshore, both affecting the morning sunshine and visibility.

Water supplies were ample both for industrial and domestic purposes, quite in contrast with the shortages of recent seasons.

The average Section temperature, based upon the records from 153 stations, was 66.5°, which is 0.7° below the mean for the past 64 years. The highest monthly average reported was 72.3° at Waterbury City Hall, Conn.; the lowest was 58.6° at Fabyan, N. H. The highest temperature reported was 93° at several stations, on the 1st or 30th, the lowest 31° at Fabyan, N. H., on the 6th. The average monthly precipitation, based upon the records of 160 stations, was 3.87 inches, which is 0.14 inch more than the mean for the past 64 years. The greatest monthly amount reported was 9.82 inches at Edgartown, Mass., the least 1.73 inches at Middleton, Mass. The greatest precipitation in any observational day was 5.11 inches at Edgartown, Mass., measured on the 9th.

TORNADOES: The outstanding meteorological phenomenon of August, 1951 was the development of a series of small tornadoes along a squall-line which on the afternoon of the 21st extended from western Connecticut through southeastern New Hampshire. While these fell far short of attaining such energy as those which occur over western plains, they did create havoc over limited areas. Fortunately, their paths traversed mostly thinly settled or open country, thus limiting possibilities of destruction to man-made structures. Evidently a number of whirls, miles apart, formed along the squall-line, each pendant from dense, dark cumulonimbus, the bases of the funnels at times reaching the ground, and each maintaining its violence along a course of a fifth of a mile to 12 miles over widths varying from 20 to 100 yards. In passing over lakes, one at least, that at East Hampton, Conn., became a water spout. True tornado characteristics were observed by reliable observers, among them a meteorologist connected with the Hartford Weather Bureau Office. The funnel clouds, the lifting and twisting effect of the wind evidenced by the flying debris carried aloft, the roar, variously likened to that of "freight trains", "hundreds of jet planes", or a "giant cataract", all were commonly observed by many persons. In Litchfield County, Conn., damage occurred at Kent, New Milford, Washington, Watertown, Bridgewater, Bethlehem, Litchfield, Thomaston, and Bristol, all small towns except the last. Several persons were injured- none fatally. A man in Watertown was pinned down in a collapsed barn, and in East Hampton several employees were hurt when a fishnet factory was unroofed. Gardens were flattened, corn lodged, trees stripped, gravestones broken, windows blown outward, these being but a few of the manifestations of the fury of the wind. In most places the damage was accomplished in 20 seconds, followed by a sudden lull. In Essex County, Mass., there was a similar visitation, a storm described as a "twister" moving through North Andover, Boxford, and Byfield. Several garages were demolished; one was carried away leaving no trace of debris.

THE SUMMER OF 1951

The popular impression that this was a cool season, probably fostered by memories of inclement weekends, is not supported by a comparative analysis. The average temperature for the three summer months, was only 0.6° below the mean of the past 64 years. There were no periods of extreme heat, nor on the other hand, were there many cool nights, a single notable exception being the morning minima of the 6th and 7th of August, when some midsummer records for low temperature were broken.

While overall precipitation showed but a slight excess, there were local storms in more than the usual number, in many cases of great severity as to intensity of rain, hail, lightning and wind. Several times instability reached such a point as to produce small but destructive tornadoes, though they passed over such sparsely settled country that their capacity for damage was restricted. Though such storms are by no means common in New England, there have been in the past many instances of such calamities, not, however, in such numbers as were reported on August 29th. A few in our meteorological history reached the proportions of a major disaster, notably one at Wallingford, Conn. on August 9, 1878. This cost over 30 lives, and injuries to many more, while one at Lawrence, Mass., on July 26, 1890, killed 8 persons.

Hail was another uncommonly destructive element this summer, particularly in the tobacco fields of the Connecticut Valley. It has been stated that $3,000,000 loss was produced in that area in two storms. Severe electrical storms were uncommonly frequent: several instances of flash floods from locally excessive downpours occurred. Two were outstanding, one at Rockland, Me., on July 19, when 4.62 inches of rain fell in a 5-hour period, and the other at Edgartown, Mass., when 5.42 inches occurred on August 8. Unpleasant weekends in early summer and more than the usual amount of fogginess in the latter part of the summer dampened the vacation spirit and retarded the movement of seasonal goods. On the whole, vegetation, except distinctly dry weather crops, throve under abundant frequent rains. Grass and pasture lands were particularly productive, but there was scant opportunity between shower periods to reap and store. Food crops came to market in good volume and quality; berries and fruits were of liberal yield. A notable exception was the effect of too much rain in the potato regions of Maine. Water supply for power was adequate. Ground water levels rose to above normal, a boon to the eastern areas that were drought-ridden in two previous summers. Recovery in rural domestic water supplies has been remarkable, except in parts of southeast Massachusetts and Rhode Island, where precipitation continued deficient until recently. - M.T.N.

ACKNOWLEDGMENTS

In addition to the climatological data from some 6,000 Weather Bureau and cooperative weather stations, this bulletin series contains records from Hydroclimatic Network Stations which were formerly reproduced in the Hydrologic Bulletin Series. The Hydroclimatic Network is a nationwide net of rain gages--mostly of the recording type which produce continuous records of precipitation. It was established in 1939 at the request of the Corps of Engineers, Department of the Army, to supplement existing precipitation stations in order to provide records of rainfall intensity which were essential to the planning of flood control and related works by the Corps of Engineers. This Network, now numbering about 2,000 recording, and 1,000 non-recording rain gages, has been maintained by the Weather Bureau through working funds transferred annually to the Weather Bureau by the Corps of Engineers. These transfers averaged about $250,000 per year between 1940 and 1944, and nearly $375,000 since that date. For the years 1940-42, the Department of Agriculture transferred about $100,000 per year to provide data required in its work, and since 1947 the Bureau of Reclamation has transferred about $25,000 per year to meet the increasing needs of their program in the Western States.

Previous to the introduction of this bulletin series, data from Hydroclimatic Network stations were presented in bulletins (Hydrologic Bulletins) which were issued monthly for each of 8 drainage areas embracing the entire United States, but since the Network was established to meet the internal requirements of the Federal agencies referred to above, no provision was made for public dissemination of the data, distribution being limited to cooperating agencies and to certain public repositories. A list of locations where reference copies of the Hydrologic Bulletin Series are available for inspection may be obtained upon application to Chief, U.S. Weather Bureau, Washington 25, D. C.

Many other records published in this bulletin have been made available through the cooperation of various public offices, private agencies, and individuals as listed in the Station Index.

REFERENCE NOTES

The four digit identification numbers in the index column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the above table are in local Standard Time.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are. temperatures in °F, precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65°F Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning with July 1948.

Amounts in Table 4 are from recording gages Traces are not shown.

Amounts in Table 3 are from non-recording gages, unless otherwise indicated.

Data in Tables 3, 5, 6, and snowfall data in Table 7 are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 7:30 P.M. E.S.T.

- - No record in Tables 3, 4, 6, 7 and the Station Index. No record in Tables 2 and 5 is indicated by no entry. When hourly precipitation is missing or accumulated for several days only the first and last days are shown in Table 4.
- † Mount Washington WB, New Hampshire not used in computing averages or extremes for State or Section.
- * And also on a later date or dates.
- ° Amount included in following measurement, time distribution unknown.
- /, Gage is equipped with a windshield.
- 6 Station not equipped with recording gage, see Table 4 for 6-hourly measured amounts.
- AR This entry in time of observation column in the Station Index means after rain.
- E Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
- M 1 to 9 days of record missing, see Table 5 for detailed daily record. Degree day data, if carried for this station, have been adjusted to represent the value for a full month.
- R Daily values and monthly total from recording gage. All other data in Table 3 are from non-recording gages.
- S Storage precipitation station Precipitation measurements, made at irregular intervals, will be published in the June issue of this publication.
- SS This entry in time of observation column in the Station Index means sunset.
- T Trace, an amount too small to measure.
- V Includes total for previous month.

Subscription Price 15 cents per copy, monthly and annual, $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Treasurer of the United States Remittances and correspondence regarding subscription should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

NEW ENGLAND - SEPTEMBER 1951

W. H. Tracy, Section Director - Boston, Mass

WEATHER SUMMARY

September was perhaps a more pleasant month than any during the summer. The temperature was somewhat below normal in the first and final weeks, but the middle weeks were warm with 80 to 90° maxima in most portions. A succession of low pressure areas moving eastward along or near the northern boundary excluded any effective invasion of polar air until near the end of the month. Over much of the Northern Division the growing season was terminated by a light freeze on the 27th. On the 30th a general freeze killed all but the hardiest vegetation except in coastal areas of the Southern Division. Morning readings were in the middle 20's in interior valleys of southern and western New England, not quite so low in Maine.

Morning fogs continued with unusual persistence inland. Precipitation was generally ample and well distributed through the month except in southeastern Massachusetts and southwestern Connecticut, where some stations reported totals of an inch or even less. The driest station was Chatham, Mass., with 0.23 inch for the entire month. The most generous rains were in central New Hampshire and western Vermont, where a few stations received over five inches. Rain on the 2d was heavy in southern New England, particularly in the lower Merrimack Valley, Haverhill, Mass., reporting 3.37 inches in the first three days. Thunderstorms on the 6-7th brought heavy showers in parts of Northern New England. This being the Labor Day weekend, the long-continued easterly rain disappointed many who had planned their season's end holiday recreation.

In southeastern Massachusetts and in parts of Connecticut where rains of recent months have not been sufficient to restore water shortages incurred during the droughts of the past two years, ground water levels were low and falling. Elsewhere water supplies were commonly quite adequate, stream flow and reservoir storage above normal.

The continued fine pasturage aided all elements of the dairy industry. The weather likewise favored harvesting and storage of potatoes, though some northern fields were adversely affected by more than adequate rainfall, conducive to late blight. Cranberries made good growth and late varieties attained large size, but frost on the 30th damaged some that were unharvested. A heavy crop of apples of better than average size and quality was being harvested. Tobacco cutting and curing operations proceeded under generally satisfactory weather conditions.

The average Section temperature, based upon the records from 158 stations, was 60.3° which is .1° above the mean for the past 64 years. The highest monthly average reported was 67.8° at Provincetown, Mass.; the lowest was 52.8° at Somerset, Vt. The highest reported was 91° at Woodland, Me.; the lowest was 20° at West Burke, Vt., and Birch Hill Dam, Mass.

The average monthly precipitation, based upon the records of 158 stations, was 2.81 inches, which is 0.89 inch less than the mean for the past 64 years. The greatest monthly amount reported (excluding Mt. Washington), was 5.68 inches at Landaff, N. H.; the least was 0.23 inch at Chatham, Mass. The greatest amount reported in any obvational day was 2.57 inches at Salisbury, Conn., on the 2d. - M.T.N.

ACKNOWLEDGMENTS

In addition to the climatological data from some 6,000 Weather Bureau and cooperative weather stations, this bulletin series contains records from Hydroclimatic Network Stations which were formerly reproduced in the Hydrologic Bulletin Series. The Hydroclimatic Network is a nationwide net of rain gages--mostly of the recording type which produce continuous records of precipitation. It was established in 1939 at the request of the Corps of Engineers, Department of the Army, to supplement existing precipitation stations in order to provide records of rainfall intensity which were essential to the planning of flood control and related works by the Corps of Engineers. This Network, now numbering about 2,000 recording, and 1,000 non-recording rain gages, has been maintained by the Weather Bureau through working funds transferred annually to the Weather Bureau by the Corps of Engineers. These transfers averaged about $250,000 per year between 1940 and 1944, and nearly $375,000 since that date. For the years 1940-42, the Department of Agriculture transferred about $100,000 per year to provide data required in its work, and since 1947 the Bureau of Reclamation has transferred about $25,000 per year to meet the increasing needs of their program in the Western States.

Previous to the introduction of this bulletin series, data from Hydroclimatic Network stations were presented in bulletins (Hydrologic Bulletins) which were issued monthly for each of 8 drainage areas embracing the entire United States but since the Network was established to meet the internal requirements of the Federal agencies referred to above, no provision was made for public dissemination of the data, distribution being limited to cooperating agencies and to certain public repositories. A list of locations where reference copies of the Hydrologic Bulletin Series are available for inspection may be obtained upon application to Chief, U.S. Weather Bureau, Washington 25, D. C.

Many other records published in this bulletin have been made available through the cooperation of various public offices, private agencies, and individuals as listed in the Station Index.
